A good network design should therefore seek to optimize both spatial and temporal coverage within the constraints of available resources. The previous section focused on maximizing spatial coverage and the representativity of measurement. Fixed monitoring stations poorly describe exposure for a short time period. However, personal exposure is better related to ambient levels when 8-hour or longer time averages are used. Emission data and the location of the most important sources give valuable information on the hot spots for the siting of monitors.

At the time of the quake Taiwan had the most extensive network of sensors and monitoring stations in the world, resulting in "probably the best data set ever collected for an earthquake".[13] At one station, a peak ground motion of 300 cm/s (3 m/s; 10 ft/s) was recorded, the highest ever measurement taken in an earthquake anywhere.[11] Soil. The most commonly used vegetation index for monitoring agricultural drought is the Normalized Difference Vegetation Index (NDVI) [28]. There are also a number of other indices based on optical and thermal bands such as the Vegetation Condition Index (VCI), Temperature Condition Index (TCI), Normalized Difference Water Index (NDWI), and Vegetation Health Index (VHI) [15,29]. ... In recent years, the damage from droughts to the environment and economies of some countries was extensive, and the death toll of livestock and wildlife was unprecedented. Weather data often come from a very sparse meteorological network, incomplete and/or not always available in good time to enable relatively accurate and timely large scale drought detection and monitoring. Monitoring results represent only the point and time where and when the sample was taken or the measurement was made. The sampling strategy must be carefully planned to make the best use of the available time and the number and location of monitoring sites. The concentrations of pollutants in indoor locations are not the same as those outside these same places. Ventilation systems filter away a portion of some pollutants, but certain indoor sources might also increase the indoor concentrations of these pollutants.
