Transmitted polarizing microscopy. In this method, a rock cutter is used to cut a thin slice of rock. One side is polished and the specimen is fixed on to a glass slide using an adhesive. Subsequently, the opposite side is also polished and fixed to a cover glass using balsam. Immersion method. In this method, the rock is ground to a fine powder and then sprinkled on a glass slide. Liquid crystals are materials with properties in between liquids and solids. Polarizing microscopes are used to detect peculiar optical patterns and phase defects in liquid crystals. They can also be used to determine if a crystal is optically positive or negative. Liquid crystal retardation can also be measured using polarized microscopes. Macromolecular materials.
