An emulsion is a dispersion of one liquid in another, immiscible liquids usually in the presence of stabilizer molecules are called emulsifiers. Emulsions may be either oil droplets dispersed in water or water droplets dispersed in oil wherein the droplet diameters are in the 0.05–100 μm range. Emulsifiers may be anionic, cationic, nonionic, or combinations of ionic and nonionic. The process of mixing is known as emulsification and has a significant effect on the resulting emulsion [38]. The droplet size distribution of emulsions with identical composition can be either monomodal [39] or bimodal [40] depending on the specific method of preparation. Ostwald ripening is a process by which large droplets grow in size at the expense of smaller droplets. -Pharmaceutical Technology About Volume 3: Basic Theory/Measurement/Applications This volume, like its predecessors, is highly recommended to all separation scientists, colloid and surface chemists, and chemical engineers. -- Separation and Purification Methods.
